

***GE Research & Development Center***

*Industrial development & applications of UV photonic systems*

*Danielle Walker*

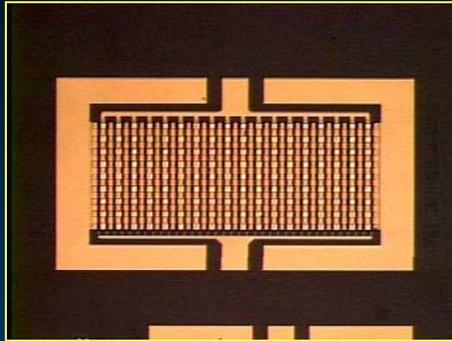

*Ed Stokes*

*Semiconductor Technology Program*

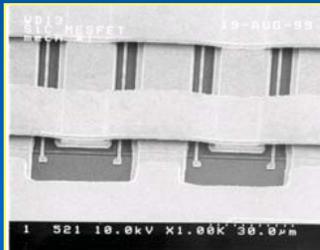

## Microwave Devices

**SiC and GaN Microwave Programs for Lockheed Martin Phased Array Radar**

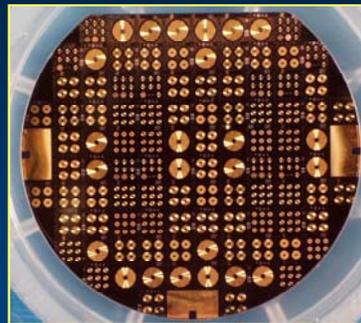

- High Voltage operation (2x Si, 4x GaAs)
- Simpler Phased Array Prime Power Distribution
- High Temp. operation (2x Si, 3x GaAs)
- Much higher Transmitter Power (3x Si, 10x GaAs)
- Simpler cooling

**•SEM of SiC MESFET Built on 1 3/8" Wafer**

## Power Devices

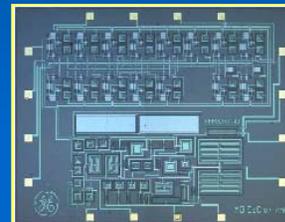

- 4000 V, 5 A PiN SiC Diodes
- 350 °C Package
- Fast switching and small reverse recovery time

- High Temperature, high voltage diodes (GEAE, GEMS, GEL)
- High V (600-1200 V) switches (GEL)
- LM pulsed power (E-gun)

## Future Integration Capabilities

Chopper stabilized SiC op amp

## Optoelectronic Devices

GELcore Produced LED's

SiC Flame Sensors  
•Gas Turbine Flame Tracker

AlGaIn-photodiode sensor system

# SiC UV photodiodes

## GE SiC Flame Sensor for Gas Turbines

- Produced by GE Reuter-Stokes
- First Commercially Used SiC Device

### Advantages

- 10x the sensitivity of Geiger-Mueller sensors
- Low voltage operation
- Fast response time
- Wide dynamic range to track flame dynamics
- Reduces Turbine costs by \$1M/Turbine

- Volume**
- 6,800 devices installed in turbines
  - 15,000 shipped by year end

## System Integration Challenges:

### 1) Material

- Development with CREE
- Theoretical Design Work
  - Tailor epitaxial layers
- Uniformity
- Dark Current
- Dual (CREE/ CRD) Processing

### 2) Packaging

- Sensor signal processing
- High impedance feedback circuit
- Ceramic vs. glass headers
- Thermal Cycling

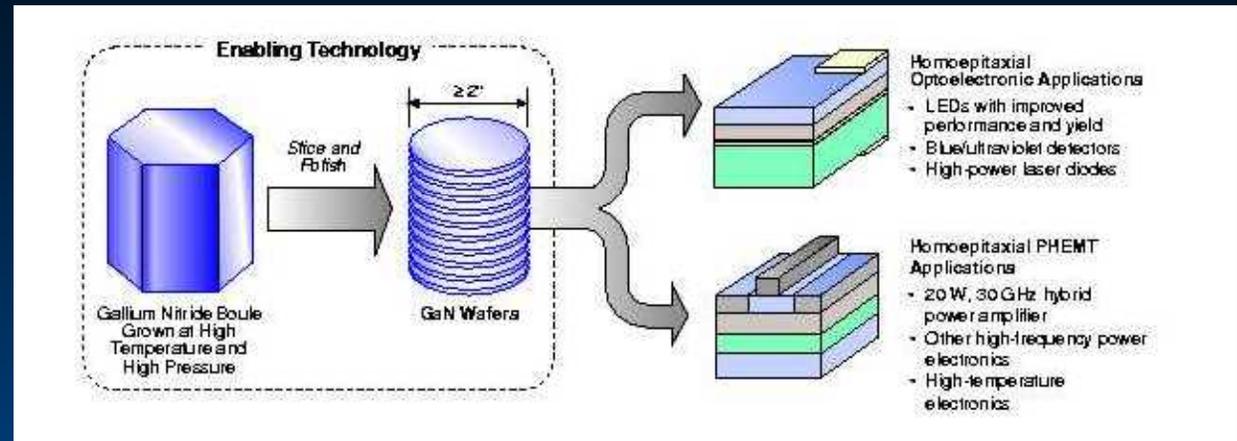

### 3) Qualification Procedures

- Vibration Tests
- Centrifuge Tests
- Thermal Cycling Tests

## Project Objective

- ✓ Develop technology to manufacture 2" GaN wafers to support burgeoning industry
- ✓ Quantify performance in state-of-the-art homoepitaxial devices (LEDs, high-frequency amplifiers)

## Core Innovation

- Link GE high pressure technology, growth chemistry for GaN

## Key Technical Challenges

- Adapt growth chemistry to high-pressure cell
- Scale GaN crystal size up to 50 mm
- Quantify device performance advantages

JV: GE Corp. Research & Development; Sanders. Subcontractor: Cornell University  
ATP Project Number: 99-01-2069  
Project Start/End Dates: 11/1/99-10/31/02  
ATP Project Manager: Elissa Sobolewski

## NIST ATP: Manufacturable solid state lighting

GE Corporate Research  
& Development

Conventional encapsulation epoxy absorbs blue and uv light, resulting in yellowing and light loss in packaged LED's (e.g. Osinski & Barton)

Conventional epoxy  
after 600 hrs UV aging

CRD UV-resistant epoxy  
after 600 hours UV aging

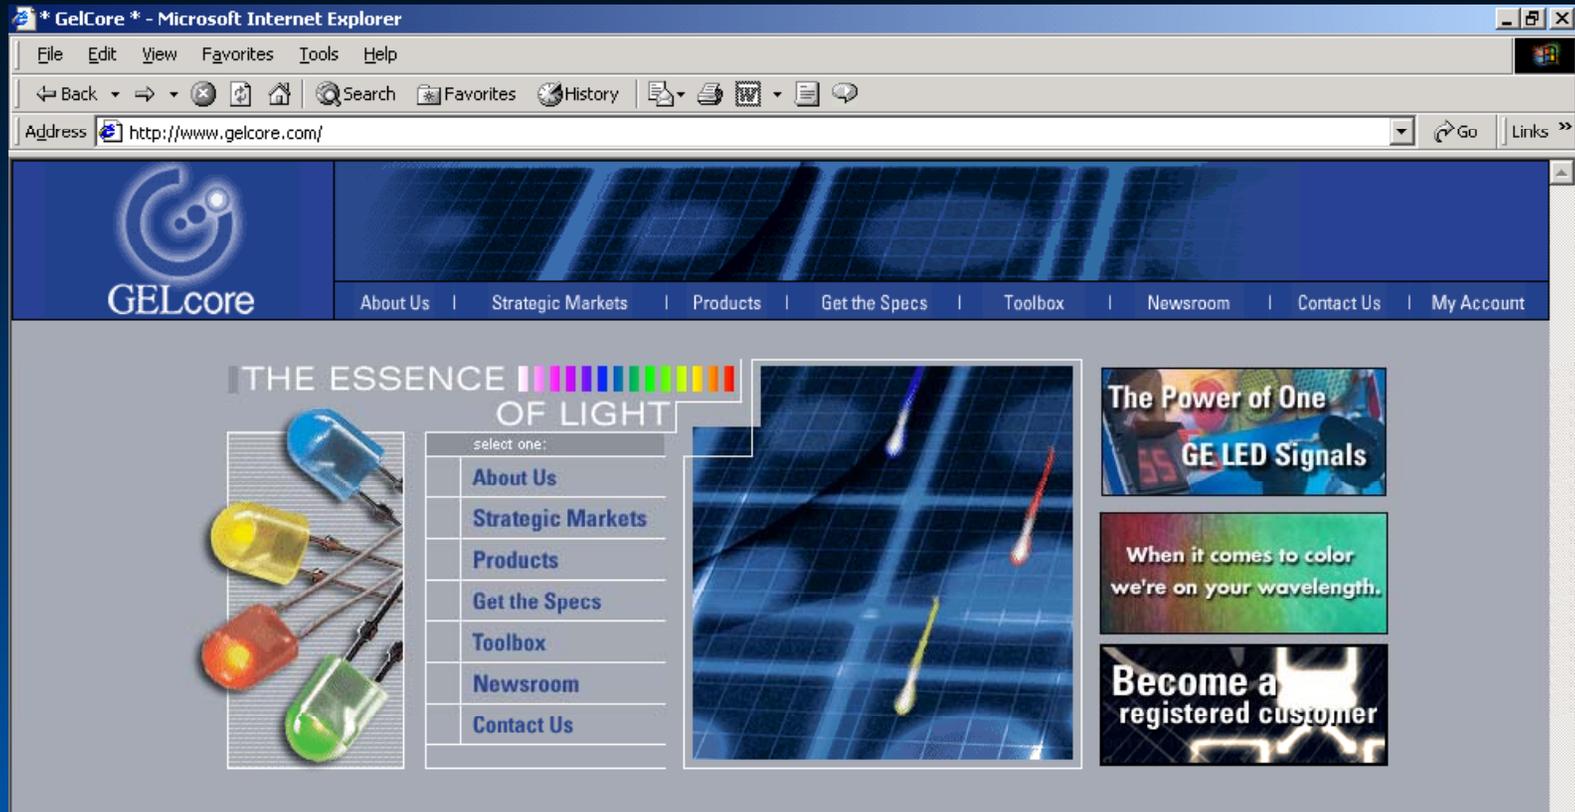

***Encapsulation development will be more  
challenging for deep UV LED's***

*NIST ATP: Cree Lighting: InGaN LED's  
GE CRD: Phosphors & encapsulation*

# GELcore

*GE Corporate Research  
& Development*

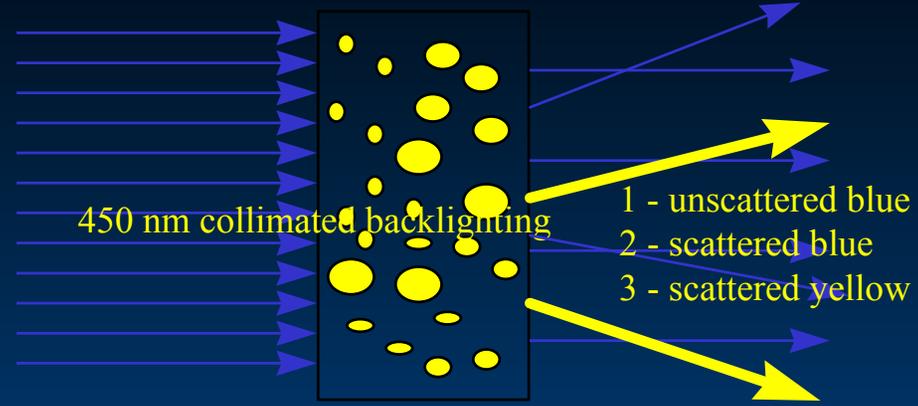

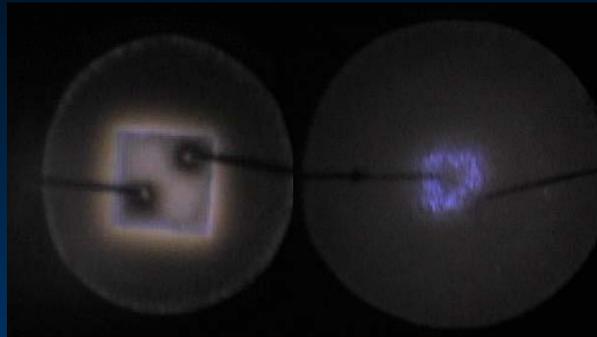

*GELcore JV: 51% GE Lighting, 49% Emcore  
Emcore: Epitaxial materials growth  
GE Lighting & GE CRD: Phosphors, packaging, reliability*

*Semiconductor Technology Program*

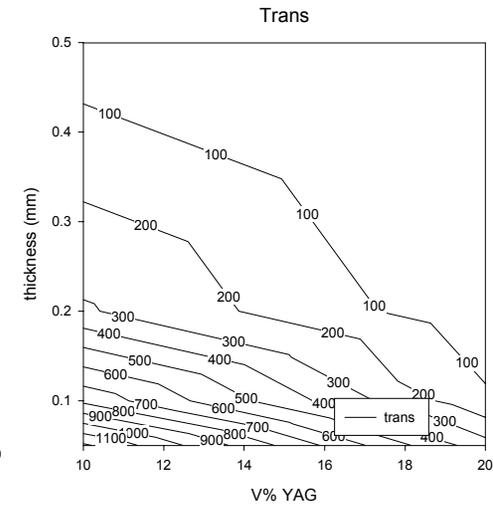

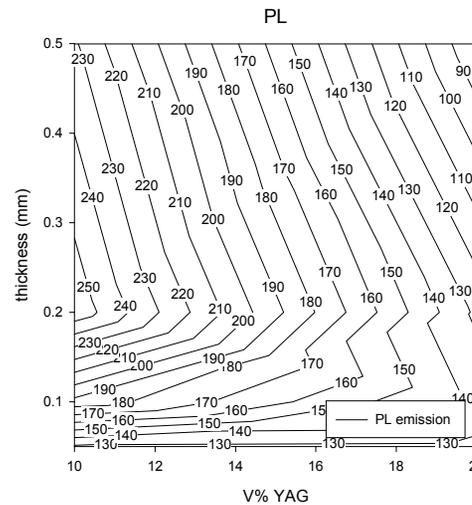

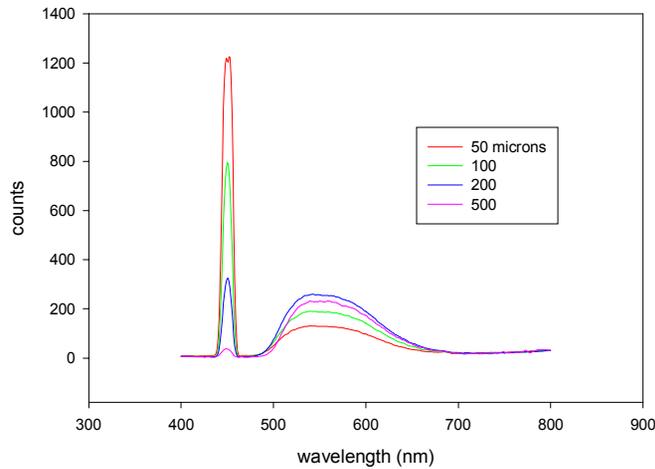

# Downconversion: optimization of phosphor layer

GE Corporate Research & Development

PL emission (10% YAG:Ce, 450 nm excitation, 0.1 W/cm<sup>2</sup>)

*For blue LED + YAG:Ce, some blue bleedthrough required to make white*

# Fiber optic bioprocess monitoring

GE Corporate Research & Development

## Fluorescence monitoring of biochemical waste treatment media

Figure 3: Fiber optic fluorescence probe

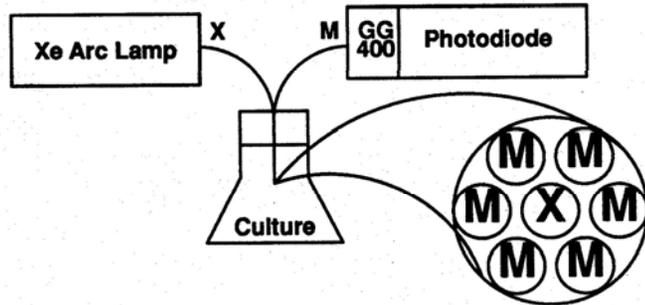

Figure 2: Emission vs. OD: 48 hours p.d./glucose

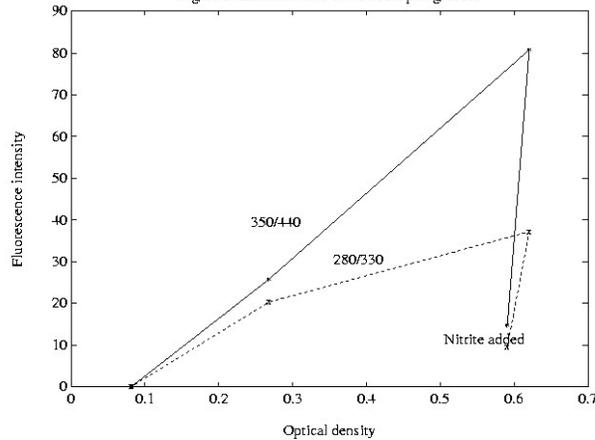

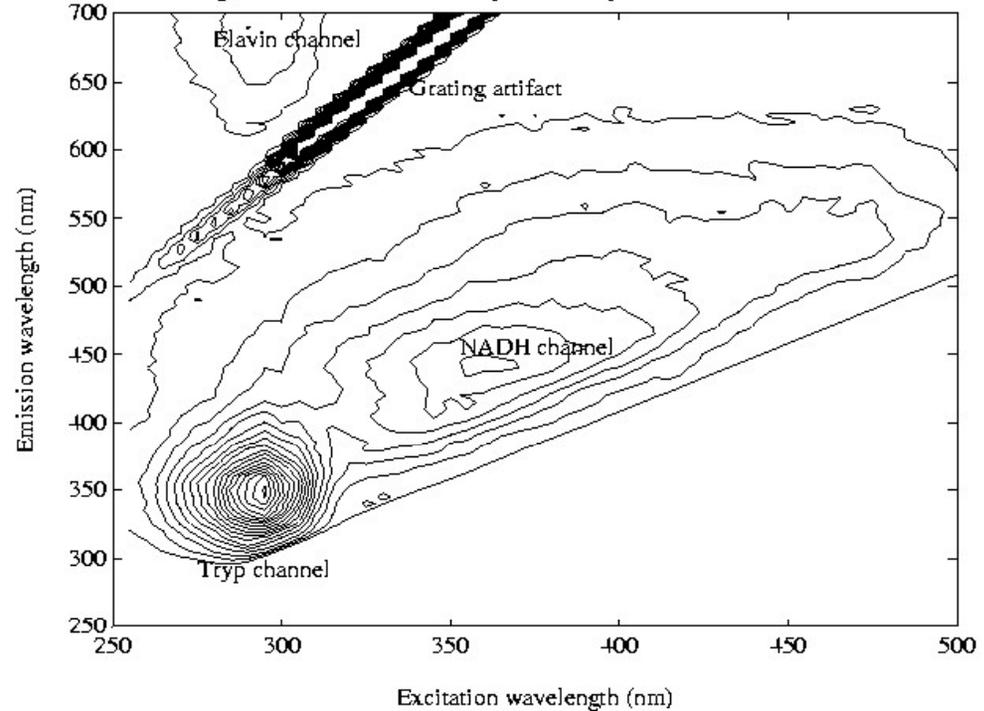

Figure 6: Total fluorescence spectrum of pseudomonas denitrificans

## Secondary inner filter effect: tryp emission pumps NADH

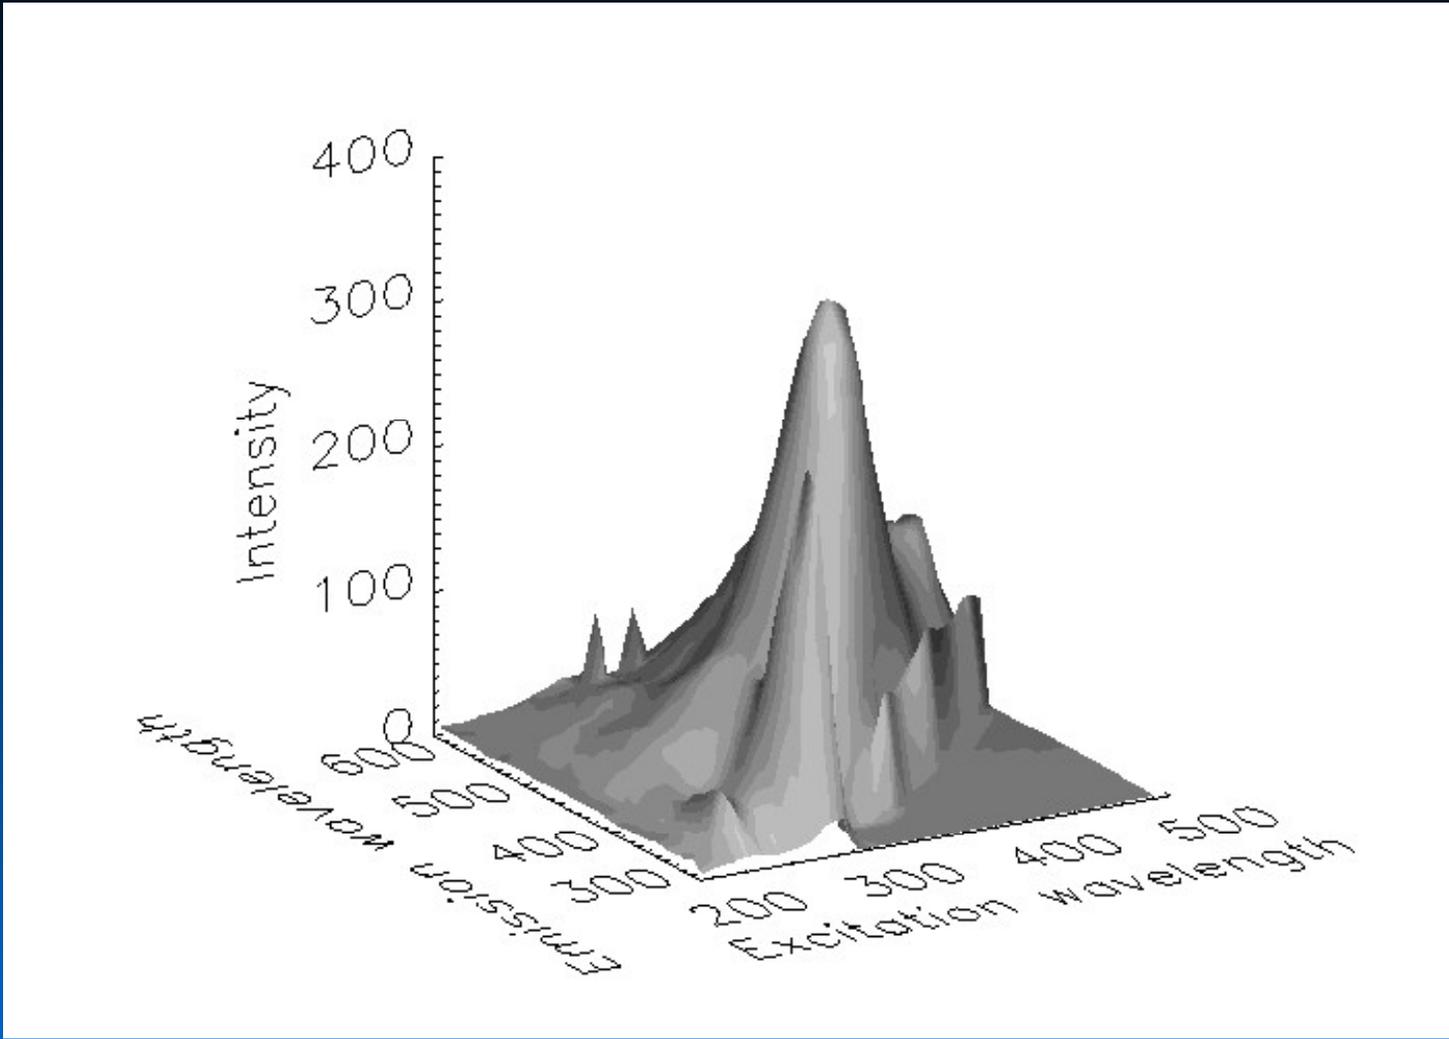

Stokes & Uzgiris, (1) Biophysical J, 61 A315, 1992, (2) Proc Intl Conf Env Cont (1992)]

Semiconductor Technology Program

# Fluorescence of biological material

GE Corporate Research & Development

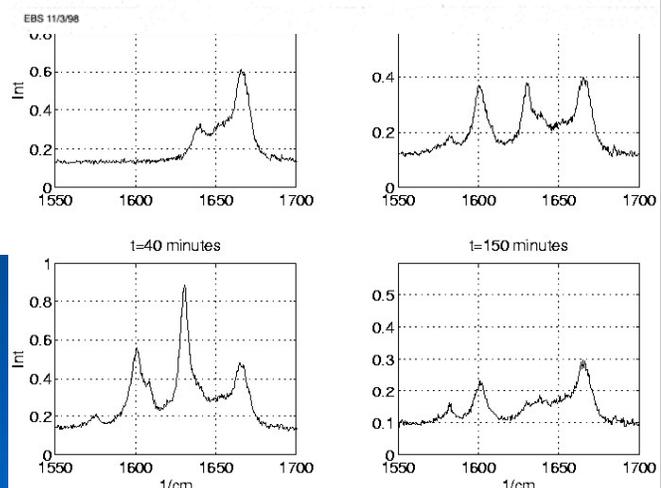

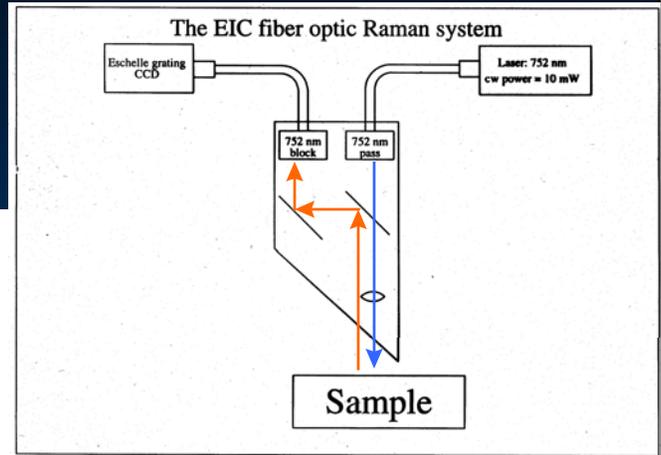

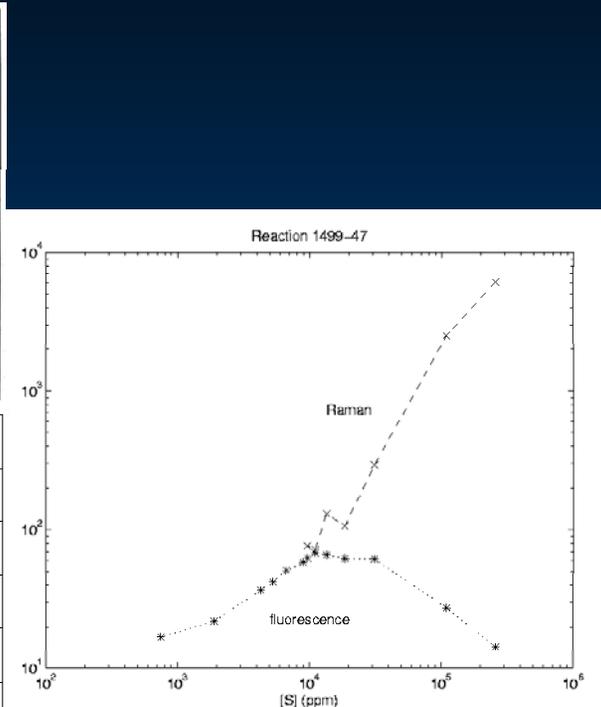

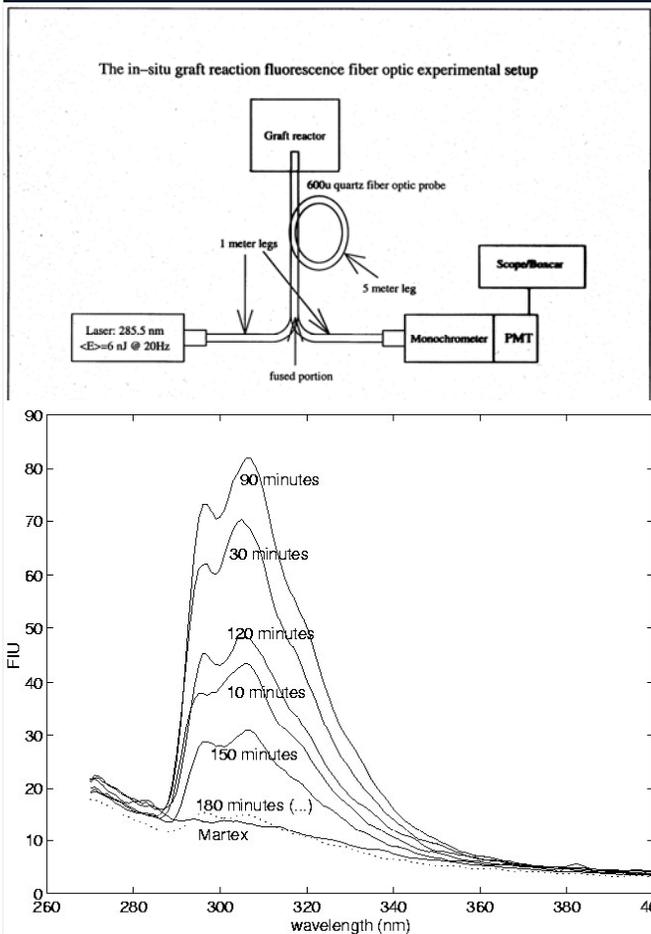

*Complex fluorescence signature requires post processing*

# Polymer manufacturing process monitoring

GE Corporate Research & Development

## Lab demo of FO monitoring of ABS polymerization

### Cheap light sources would enable industrial process monitoring

Fiber optic probes used to monitor styrene concentration (intensity + lifetime) in ABS polymerization reaction: Raman excited at 850 nm tracks styrene down to 1%, fluorescence excited at 295 nm tracks styrene down to below 1000 ppm [Stokes, Codella, Resue, England, Pattanayak, ECS 1998]

# Polymer manufacturing process monitoring

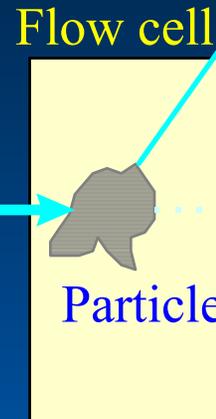

GE Corporate Research  
& Development

*Light scattering used for contaminant counting/sizing in optical polymers*

Parameters:  
wavelength  
power  
cw or pulsed

Light source

Parameters:  
path length  
materials  
flow cross section  
flow rate / velocity

Scattering  
detector  
(0.1-3 $\mu\text{m}$ )

Extinction  
detector  
(3-500 $\mu\text{m}$ )

Parameters:  
solid state / PMT  
sensitivity  
response time

*Integration of “flow cytometry” techniques (FLAPS: Fluorescence Aerodynamic Particle Sizer: use UV abs + fluorescence and scattering) would enable classification as well as sizing*

## Summary

*GE Corporate Research  
& Development*

### 1 – Industrial applications

- A – Chemical and biological process monitoring
- B – Contaminant particle counting and classification in optical polymers
- C – Optical storage ?
- D – General illumination (requires appropriate phosphors) ?
- E – UV water sterilization ?

### 2 – System requirements for liquids

- A - Reliable packaging: UV resistant polymers
- B - Low cost: (~\$100-\$1000)
- C - Low maintenance
- D - High reliability (~10,000 hour MTBF)
- E - Relatively low power for fluorescence (~10-100 uW for 100-1000 ppm)
- F - Higher power for Raman (~100 mW for 0.1 to 10%)

### 3 – General comments

- A - Multiple spectroscopies + light scattering (FLAPS) enhances selectivity
- B – Fluorescence lifetime for molecular interaction info
- C - For airborne material, need either:
  - 1 – Higher power, or
  - 2 – Sample concentrator
